

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Currently Amended) A method for handoff of a medium rate data call in a mobile communication system, comprising:

comparing a pilot strength of a BTS (Base Station Transceiver Subsystem) to which a SCH (Supplemental Channel) is allocated to a pilot strength of a BTS to which the SCH is not allocated, without comparing the pilot strengths to a predetermined threshold value;

transmitting a PSMM (Pilot Strength Measurement Message) from a mobile station to a base station including ~~[[a]] the BTS (Base station Transceiver Subsystem)~~ to which ~~[[a]] the SCH (Supplemental Channel)~~ is allocated when ~~the~~ ~~[[a]]~~ pilot strength of the BTS to which the SCH is allocated is smaller than ~~[[a]] the~~ pilot strength of ~~[[a]] the~~ BTS to which the SCH is not allocated ~~among a plurality of BTSs communicating with the mobile station;~~ and performing a handoff of the SCH to the BTS to which the SCH is not allocated, according to the PSMM.

2. (Previously Presented) The method according to claim 1, wherein, for a medium rate data service, a FCH (Fundamental Channel) handoff procedure and a SCH handoff procedure are separately performed.

3. (Previously Presented) The method according to claim 2, wherein a SCH handoff is performed with respect to a predetermined number of BTSs having a pilot strength strong enough to combine both FCH and SCH pilot signals by the mobile station among the BTSs communicating with the mobile station.

4. (Currently Amended) A method for requesting a handoff of a medium rate data call of a mobile station, comprising:

measuring a pilot strength of a BTS (Base Station Transceiver Subsystem) to which a SCH (Supplemental Channel) is allocated and a pilot strength of another BTS to which the SCH is not allocated ~~among BTSs communicating with the mobile station; and~~

comparing the pilot strength of the BTS to which the SCH is allocated with the pilot strength of the another BTS to which the SCH is not allocated, without comparing the pilot strengths to a threshold; and

transmitting a PSMM (Pilot Strength Measurement Message) to a base station including the another BTS requesting a handoff, when the pilot strength of the BTS to which

Office Action of November 2, 2004

the SCH is allocated is smaller than the pilot strength of the BTS to which the SCH is not allocated as the result of the measurement.

5. (Currently Amended) A method for performing a handoff of a medium rate data call of a base station:

analyzing a PSMM (Pilot Strength Measurement Message) transmitted from a mobile station;

comparing a pilot strength of a first BTS (Base Station Transceiver Subsystem) to which a SCH (Supplemental Channel) is allocated with a pilot strength of a second BTS to which the SCH is not allocated, if the allocation of the SCH is required, without comparing the pilot strengths to other variables;

allocating the SCH to ~~the BTS to which the SCH is not allocated and the BTS to which the SCH is allocated~~ both of the first and second BTSs, if the pilot strength of the second BTS ~~to which the SCH is not allocated~~ is larger than the pilot strength of the first BTS ~~to which the SCH is allocated~~ as the result of the comparison[[,]] and the pilot strength of the first BTS ~~to which the SCH is allocated~~ is higher than T_ADD; and

allocating the SCH to a BTS having a largest pilot strength, ~~if the SCH is not allocated to an active BTS~~ if analyzing the PSMM determines the SCH is not allocated to any BTS, when a DROP of the BTS to which the SCH is allocated is required.

Office Action of November 2, 2004

6. (Currently Amended) The method according to claim 5, wherein if the pilot strength of the second BTS ~~to which the SCH is not allocated~~ is larger than the pilot strength of the first BTS ~~to which the SCH is allocated~~, and the pilot strength of the first BTS to which the SCH is allocated is not higher than T_ADD, the allocation of the SCH to the ~~active~~ second BTS ~~to which the SCH is not allocated~~ is performed and the release of the SCH resource from the first BTS ~~to which the SCH is allocated~~ is performed.

7. (Currently Amended) The method according to claim 5, wherein, as the result of comparing, if the pilot strength of the second BTS ~~to which the SCH is not allocated~~ is larger than the pilot strength of the first BTS ~~to which the SCH is allocated~~, it is judged that a new pilot signal ~~having a pilot strength larger than the pilot strength of the BTS to which the SCH is allocated~~ corresponding to the pilot strength of the second BTS is to be added, and if the pilot strength of the BTS of which ~~an ADD~~ a handoff is to be performed is higher than a reference threshold, a handoff is performed by simultaneously allocating both FCH and SCH to the BTS of which the ~~ADD~~ handoff is to be performed.

8. (Currently Amended) The method according to claim 7, wherein the reference threshold, which is a value previously set by a radio environment test, is set higher than T_ADD for the ADD handoff, and is set higher than T_DROP for a DROP handoff.

9. (Currently Amended) The method according to claim 5, wherein ~~the~~ a total
number of BTSs ~~in the active set~~ included in an active set is set to less than six.

10. (Currently Amended) A handoff method, comprising:
comparing a pilot strength of a first BTS (Base Station Transceiver Subsystem)
to which a SCH (Supplemental Channel) is allocated with a pilot strength of a second BTS to
which a SCH is not allocated, without referring to threshold values; and
performing a handoff to the second BTS when the pilot strength of the first BTS
is smaller than the pilot strength of the second BTS.

11. (Previously Presented) The method of claim 10, wherein a FCH (Fundamental
Channel) handoff procedure and a SCH handoff procedure are separately performed.

12. (Previously Presented) The method according to claim 10, wherein the SCH
handoff is performed with respect to a predetermined number of BTSs having a pilot strength
strong enough to combine both FCH and SCH pilot signals by the mobile station among the
BTSs communicating with the mobile station.
